Adapt Engine 2025.1 GA Release Notes

Description	Release Notes	Issue ID
Update to OpenJDK Java21	The main change for this release is that the Adapt engine has been updated and now requires a Java21 installation. The version we have been using is Adoptium Temurin, the OpenJDK version maintained by the Eclipse foundation. There is additional documentation to cover the upgrade process.	AD-11963
Update Adapt dependencies to the latest versions	All third party libraries used by adapt have been updated to the latest Java21 compatible versions where possible	AD-13071
Sales Studio - Contact Preview - 'Hide Toolbar' is still shown instead 'Show Toolbar' when it's already hidden	Fixed an issue where the toolbar toggle button in Contact Preview incorrectly displayed "Hide Toolbar" even when the toolbar was already hidden. The button now properly shows "Show Toolbar" when the toolbar is hidden and "Hide Toolbar" when the toolbar is visible.	AD-4954
On Modify is not run for the second time when a value in a field is cleared	An issue was addressed where an "On Modify" business object (BO) did not run a second time when a date field is cleared repeatedly, causing validation warnings to fail on subsequent clears.	AD-6309
My Studios-Widget tabs: Tab icons are not aligned	We have made styling improvements to the studios to better align the tab icons.	AD-13112

My Studios - Widget: Header icons are not aligned	We have made styling improvements to the studios toolbar	AD-13113
Styles not applied to Search Parameters areas	Fixed a styling issue with text area controls that are modified by business objects	AD-13116
Journal Filters: Styles incorrectly applied to Groups and Users placeholders	Fixed a bootstrap styling issue related to dropdown combo boxes	AD-13117
Journal Filters: Styles incorrectly applied to Groups and Users placeholders	Resume Import UI Issue Fixed: Resolved a jquery related display bug where the left sidebar section became malformed after being opened by clicking resume tags. The section now properly collapses and expands as expected when using the arrow button controls.	AD-13122
A user can't display journal notes in the recruitment studio	This ticket addresses a bug where a user could not display journal notes in the recruitment studio due to pagination issues. Issue caused by persistence of current page number when switching between entities with different journal entry counts. If switching from a user with many entries (e.g., page 4) to one with fewer pages, the list appeared blank.	AD-13124
Reformatter - filter "not equals to" also excludes NULL values	Added a new checkbox on the reformatter filter condition to allow the query to include items with null values.	AD-13136
Added a new checkbox on the reformatter filter condition to allow the query to include items with null values.	Added a new checkbox on the reformatter filter condition to allow the query to include items with null values.	AD-13137
Stored XSS vulnerability in Journal Filter dialog	Resolved a potential XSS vulnerability in the Journal Filter dialog.	AD-13137
Sysadmin-Resume Import: Not possible to delete schemas	Resolved an issue where the delete button did not respond when trying to delete a resume import schema.	AD-13141

Sysadmin-Domain Branding: The color code stops displaying in the "Selected color" field after clearing the field and selecting a new color	Fixed a bug in the sysadmin colour picker where the hex colour code wasn't displayed after being cleared and a new colour selected.	AD-13143
Candidate creates directly from QuickFind	Fixed a bug caused by the iframe removal work where in the quickfind create candidate functionality might fail due to there being 2 parameters that held the profile details which may or may not have been initialised at the time of running the workflow.	AD-13144
Potential XSS in StudioManager when user group name contains an exploitable string	Security Enhancement - XSS Prevention in StudioManager Fixed a potential cross-site scripting (XSS) vulnerability in StudioManager that could be triggered when user group names contained malicious script code. The vulnerability occurred when navigating to the "My Studios" page with exploitable group names visible, but could not be easily reproduced in normal usage since group name creation was already protected against XSS. This security fix ensures that any legacy group names with embedded scripts are properly sanitized and no longer pose a security risk.	AD-13147
Fastfind highlighting breaks HTML	Fixed an issue in FastFind search functionality where searching for terms containing specific character combinations (like "AATTCAD229 c*") caused HTML malformation on results pages due to improper handling of highlighting markup.	AD-13151
FastFind doesn't use latest formatter settings from the profile	Fixed an issue where changes to FastFind column configurations in SysAdmin were not immediately reflected in the user interface, requiring users to log out and back in to see updates.	AD-13155
Task Dashboard: Malicious XSS script execution via User Task field	Resolved a potential XSS vulnerability in the Task Dashboard.	AD-13157
Potential XSS in Calendar filter when user group name contains an exploitable string	Resolved a potential XSS vulnerability in the Calendar Filter Dialog.	AD-13159
Languages not showing on sysadmin user overview page	Fixed a display issue where the default language was not being shown on the domain access pane of the Edit User page in sysadmin.	AD-13162
FastFind: New category added in sysadmin appears as null in UI	When a new category is created in sysadmin, the entered description is now used to populate all language fields. In FastFind, this new category is displayed with the correct title.	AD-13167

Sysadmin: Potential XSS vulnerability in FeedAdapters page	Resolved a potential XSS vulnerability in the Feed Adapter.	AD-13175
Studios. When adjusting the size of one widget it affects those above and below.	Studios Widget Resizing Fixed Fixed an issue where adjusting the size of one widget in Studios would unintentionally affect the display of widgets above and below it. The problem occurred specifically in scrollable studio layouts where clicking the calendar button could trigger incorrect resize functionality, causing widgets to become stuck at minimum height. Widget resize handles now appear correctly when hovering over widget borders, allowing proper height adjustment through click and drag operations.	AD-13177
Widgets: Toolbar buttons have increased height	Studio taskbars have been updated for consistency and improvements made for resizing.	AD-13179
Combined Job, Contact, Timesheet, Workers Searches: No results returned when using valid search criteria	The actual problem here was that the formatter settings had a filter applied which was restricting the results being returned. As this is not really clear to the user, we have added a filter icon to the search results to show that a filter is active.	AD-13185
Saved Results: BO execution fails while running Batch Timesheets	Fixed an issue where the Batch Timesheets workflow would fail with an "Unknown BO Exception, TSOTimesheetBatch:97" error when accessed through Activities - Batch - Batch Timesheets from saved search results containing Temp Shift Assignments. Users can now successfully create and review Temp Shift timesheets using the batch option as intended.	AD-13191
Sysadmin: Feed Manager Authorisation Failed popup appears on Feed Adapters page	Corrected an issue with the refresh code in the feed manager that displayed an erroneous error message when left idle on the page for several minutes.	AD-13195
Segment tool failing to import and export some segments to file	This was due to the config tools requiring extra parameters when being run with Java21. The JNLP files and batch files for running the tools have been updated to provide these values.	AD-13196
Potential XSS in Call Back widget when Person or Client names contain an exploit	Resolved a potential XSS vulnerability in the Call Back widget.	AD-13199

Studios: Candidate Consent widget doesn't load	Fixed an issue that turned out to be overzealous XSS protection that was preventing certain legal operations from working.	AD-13201
Unable to create an overridden domain profile in sysadmin	Fixed a system error that occurred when attempting to create overridden profiles in System Administration. Users can now successfully click the "Override a profile" button in the Overridden Profiles section and will be presented with the expected list of all users and their profiles to choose from for override. NOTE there is still an issue with editing overridden profiles which has been postponed to a future release.	AD-13204
Studios: Bottom outline of sub-widgets is clipped	Fixed a bug which was incredibly hard to replicate. This is because it only happens the first time you load a studio after clearing the browser cache on a low latency connection as the Javascript has resized the studio before the icons have loaded and potentially changed the height of the toolbar if they caused it to wrap to a new line	AD-13206
500 error alert when trying to log in with new profile	Fixed a HTTP 500 error that occasionally occurred when logging in with newly created domain profiles after saving control panel settings without configuration changes. The issue was caused by invalid keys being persisted in the control panel settings database. Users can now create new domain profiles, configure control panel settings, and log in successfully without encountering the browser alert popup or home page loading failures.	AD-13207
Journal: "Sort by Column" setting is not saved	Fixed an issue where the sort by column setting on journal settings was not being saved when all other options were.	AD-13212
