Breaking down Job Titles

Just like on the BD side of the platform, you can split out your job title from "DevOps Engineer" to "DevOps" AND "Engineer".

Searching for Candidates this way will ensure you're returning all candidates with the keywords you require, in any order, and will return candidates that you will have otherwised missed.

Above are all examples of job titles from LinkedIn that were uncovered by splitting out the job title.

Acess to More Candidates

Clicking the search name will take you to the SmartSearch Filter. This enables you to expand your search from your 10/10 candidate results to show you 9/10, 8/10 etc.

By simply toggling your Keyword group to "Exclude" this will change your Boolean from and AND to and AND NOT. Meaning you will now have an entire new candidate pool to review that specifically does not mention those terms within their profile.
